

Policy for Environment, Health and Security (EHS)

We at FAB Support AB are proud to be able to deliver gas treatment systems that on the one hand purifies process gases to enable their use in high tech application and other hand treating process exhaust gases that can be very harmful to the surroundings. We are helping our customers to remove highly toxic, corrosive or otherwise dangerous gases and to collect them as stable solids for safe disposal. We are also able to abate inert gases that are highly effective greenhouse gases. The residual salts are collected and treated according to all rules and regulations and is reported to Naturvårdsverket (the Swedish Environmental Protection Agency) and the import of active granulates is reported to KemI (the Swedish Chemicals Agency). Our products enable a safe way of dealing with potentially dangerous substances.

We often work in facilities where our health might be at risk. Therefore, we educate our staff and always make sure that adequate safety equipment is available. Continuous education in CPR is also maintained in the company. Risks are identified and checklists made to make sure all safety aspects are considered and that work done is documented.
